WHO AM I?

We are all more than the sum of our parts, but the results below offer some of the most dramatic and fascinating information in your Geno 2.0 test. In this section, we display your affiliations with a set of nine world regions. This information is determined from your entire genome so we're able to see both parents' information, going back six generations. Your percentages reflect both recent influences and ancient genetic patterns in your DNA due to migrations as groups from different regions mixed over thousands of years. Your ancestors also mixed with ancient, now extinct hominid cousins like Neanderthals in Europe and the Middle East or the Denisovans in Asia. If you have a very mixed background, the pattern can get complicated quickly! Use the reference population matches below to help understand your particular result. **VIEW THE "WHO AM I" VIDEO**

YOUR RESULTS

Note: In some cases regional percentages may not total 100%.

WHAT YOUR RESULTS MEAN

PLAY VIDEO

Modern day indigenous populations around the world carry particular blends of these regions. We compared your DNA results to the reference populations we currently have in our database and estimated which of these were most similar to you in terms of the genetic markers you carry. This doesn't necessarily mean that you belong to these groups or are directly from these regions, but that these groups were a similar genetic match and can be used as a guide to help determine why you have a certain result. Remember, this is a mixture of both recent (past six generations) and ancient patterns established over thousands of years, so you may see surprising regional percentages. Read each of the population descriptions below to better interpret your particular result.

YOUR FIRST REFERENCE POPULATION: GERMAN

This reference population is based on samples collected from people native to Germany. The dominant 46% Northern European component likely reflects the earliest settlers in Europe, hunter-gatherers who arrived there more than 35,000 years ago. The 36% Mediterranean and 17% Southwest Asian percentages probably arrived later, with the spread of agriculture from the Fertile Crescent in the Middle East over the past 10,000 years. As these early farmers moved into Europe, they spread their genetic patterns as well. Today, northern and central European populations retain links to both the earliest Europeans and these later migrants from the Middle East.

YOUR SECOND REFERENCE POPULATION: TUSCAN (ITALY)

This reference population is based on samples collected from Italians native to Tuscany. The 54% Mediterranean and 17% Southwest Asian percentages reflect the strong influence of agriculturalists from the Fertile Crescent in the Middle East, who arrived in Italy more than 7,000 years ago. The 28% Northern European component likely comes from the pre-agricultural population of Europe—the earliest settlers, who arrived in Europe more than 35,000 years ago during the Upper Paleolithic period—and was perhaps increased during the conquest of northern Italy by the Germanic Lombards in the 6th-8th centuries. Today, the Northern European component predominates in northern European populations, while the Mediterranean component is more common in southern Europe.

SOUTHWEST ASIAN

YOUR HOMINID ANCESTRY

When our ancestors first migrated out of Africa around 60,000 years ago, they were not alone. At that time, at least two other species of hominid cousins walked the Eurasian landmass: Neanderthals and Denisovans. Most non-Africans are about 2% Neanderthal. The Denisovan component of your Geno 2.0 results is more experimental, as we are still working to determine the best way to assess the percentage Denisovan ancestry you carry. The evolution of this data is another way you are actively involved in helping advance knowledge of anthropological genetics!
